SECTION 1: SUMMARY

In the sixth year of an ongoing partnership, the University of Southern California (USC) and the Los Angeles Homeless Services Authority (LAHSA) collaborated on the design, implementation, and analysis of the 2022 Greater Los Angeles Homeless Count (HC22). For USC, the work was based out of the Suzanne Dworak-Peck School of Social Work along with partnerships at the University of California, Los Angeles, Lens Co, and Akido Labs.

The HC22 is intended to provide point-in-time estimates of the homeless population in the Los Angeles Continuum of Care (CoC) geographic area, which includes all of Los Angeles County except the cities of Pasadena, Glendale, and Long Beach. It fulfills the U.S. Department of Housing and Urban Development (HUD)-mandated Point-in-Time (PIT) Count to count, and estimate demographic characteristics of, persons experiencing literal homelessness – unsheltered and sheltered – typically during the last 10 days in January. We note that during HC22 the PIT Count was delayed by one month and occurred during the last 10 days of February due to an increase in infection rates of COVID-19 just before the regularly scheduled January period; during the 2021 Homeless Count (HC21) the unsheltered PIT Count was altogether canceled due to the COVID-19 pandemic.

The HC22 was designed to provide estimates for the Los Angeles CoC; the City of Los Angeles; eight Service Planning Areas (SPAs); the communities of Hollywood, Skid Row, and Venice; five Supervisorial Districts (SDs); and 15 City Council Districts (CDs).

Estimates of the homeless population are constructed from data obtained from a PIT Count of the unsheltered population, a demographic survey of unsheltered adults, a youth count and survey of unsheltered youth, and administrative data from the Homeless Management Information System (HMIS) covering the sheltered population, augmented by reporting from shelters not represented in HMIS. While most of the data collection and estimation procedures remained unchanged from 2020 Homeless Count (HC20), a key development for HC22 was that PIT Counts were recorded by volunteers through a new mobile app designed by Akido Labs, which was designed to replace the use of paper tally sheets as had been used in years past. This change was initially introduced to help enable remote deployment of volunteers as a potential protective measure against the spread of COVID-19. Ultimately, PIT Count volunteer deployment continued the use of in-person deployment sites while implementing protective measures (e.g. wearing face masks, requesting volunteers sign up in teams, etc.). Perhaps due to concerns related to COVID-19, there were fewer volunteers than in previous years. We also note that the COVID-19 pandemic introduced multiple other challenges that may have impacted the final estimates as will be noted in this report.

SECTION 2: ROLES AND RESPONSIBILITIES

For the HC22, USC was contracted to provide methodology and process direction, design and select all required samples, execute the demographic survey of unsheltered youth and adults, manage the youth count, and produce survey estimates.

LAHSA was responsible for all other data collection tasks, which included conducting the PIT and shelter counts, convening an advisory board committee, designing the contents of survey questions, and compiling the estimates for public presentation that may include estimates from other CoCs in Los Angeles County such as Glendale, Pasadena, and Long Beach. We note that because the PIT Count data was collected via an app in a different format than in years past, USC, LAHSA, and Akido Labs collaborated to assess the quality of and run validity checks on the PIT Count data, which has historically been completed solely by LAHSA.

SECTION 3: POINT-IN-TIME COUNT

Each January, LAHSA conducts the PIT Count in the CoC. The PIT Count is a visual-only tally of people experiencing unsheltered homelessness and the number of cars, vans, recreational vehicles (RVs), tents, and makeshift shelters assumed to be housing homeless individuals. LAHSA provides training to all volunteers who canvas designated CTs.¹

The HC22 PIT Count was conducted by volunteers in all 2,163 CTs that make up the CoC, with special outreach teams counting LA metro stops, riverbeds, and other hard to reach places. Starting in 2020, LAHSA also collected counts from Safe Parking program locations as well, which are designated areas that provide vehicle dwellers with a safe and legal place to park and sleep at night. The counts of people, but not vehicles, from thirteen Safe Parking sites were included with the visual tally to arrive at the total PIT Count. This year, 12,413 individuals, 28 family units with 111 members, and 21,965 vehicles, tents, and makeshift shelters were counted during the unsheltered PIT Count.²

3.1. PIT Count App

3.1.1. Background

Historically the Los Angeles County PIT has largely depended on very time- and resource-intensive manual processes, such as the use of paper tally sheets collected from over 8,000 volunteers to record contact information and night-of counts. These processes also include LAHSA staff printing hundreds of maps to assign census tracts (CTs)³, to volunteers, procuring and organizing hundreds of supplies (such as pens and clipboards) to accompany these maps, and manually inputting thousands of data points from volunteers' tally sheets. LAHSA staff and Deployment Site Coordinators (DSCs) also have had to manually review tally sheets submitted by volunteers throughout the night of the count to identify CTs that were not fully covered, as well as check for any anomalies. Volunteers were also required to manually keep track of areas covered within their designated CT splits and note any issues encountered while counting.

In response to the 2021 HUD exemption from the unsheltered PIT Count, LAHSA in partnership with USC and Akido Labs, redirected the resources normally used to estimate the unsheltered

¹ In 2022, with the introduction of the Akido PIT count app, volunteer training was a joint effort between Akido and LAHSA. Akido also supported a technical support line before and during the count.

² Includes 3,367 cars, 2,330 vans, 7,178 RVs, 4,304 tents, 4,786 makeshift shelters, as well as 289 individuals and 1 family units with 5 members that were counted in safe parking locations.

³ Or, more specifically, parts of them referred to as CT splits. There are 3,732 CT splits covering 2,163 CTs.

population to develop a digital phone app to conduct the PIT Count. The Akido PIT Count app was primarily developed to replace the paper tally sheets used by volunteers while still maintaining the volunteers' ability to "tally" the number of people & dwelling types counted in their assigned geographies. The app minimized contact between the organizers of the PIT Count and volunteers, which was necessary amid the ongoing global pandemic, and included an interactive map to help volunteers both navigate their CTs and keep track of areas covered. Development of the Akido PIT Count App was completed in the early summer of 2021 and LAHSA, USC, and Akido Labs subsequently conducted a pilot in Skid Row to field test the app for use in HC22.

3.1.2. HC22 PIT Count App Implementation

The HC22 PIT Count Application consisted of 2 components; a mobile application available to the general public and a web dashboard available to authorized staff. Some areas were covered by special LAHSA teams using a separate app, referred to as the Collector app, due to difficulties in the terrain or potential risk for volunteers. The Collector app also records counts and latitude / longitude coordinates. Volunteer teams did not cover these designated areas. The Collector app data was provided by LAHSA and combined with the processed clean data from the Akido app to produce the final PIT count for each CT split.

Akido Mobile Application Implementation

Volunteers downloaded the mobile application from the iOS App Store and Android Play Store. They created accounts using an invitation code specific to HC22. All users were assigned a test CT split "HC_TEST" to practice before the night of the Count.

On the night of the Count, volunteers received their CT split assignments from their Deployment Site Coordinators and entered them into the application. Once volunteers navigated to their assigned CT, they clicked "Start Count" which prompted them to input key information such as the names and contact info of partners. Upon submitting the "Start Count" survey, volunteers canvassed their CT split(s) with the aid of the app which tracked their route. Upon observing a dwelling or people experiencing homelessness, volunteers clicked "Add Tally" and submitted a tally survey containing observed counts. After volunteers finished canvassing an individual CT, they clicked "Finish Count" and submitted a survey (which included feedback on level of coverage, etc.). They repeated this process for each CT split. After volunteers finished canvassing all CTs and submitting observed tallies, they reported back to their Deployment Site Coordinator who verified their tallies using the web dashboard.

Akido Dashboard Implementation

Authorized users had access to a web dashboard which allowed users to 1) view the geotagged data in a map view and 2) download records as a CSV. Data was organized into 3 sections, Start County Surveys, Tally Surveys, and Finish Count Surveys.

Deployment Site Coordinators used the dashboard to monitor geo-tagged tally submissions in real-time across their CTs. CTs that were not properly canvassed were flagged by DSCs. LAHSA and USC staff used the dashboard to export data for their analysis.

3.1.3. HC22 PIT Count Data Reconciliation and Validation

Due to inconsistencies in how volunteers used the app with some volunteers covering multiple CT splits within a single sessions and others entering tallies only at the end of a session, as well as more than one volunteer group covering the same CT split, it was determined that data reconciliation and validation processes were needed. In order to accomplish this, USC downloaded data directly from the Akido dashboard that was collected by volunteers and staff during the 3 nights of the PIT Count and the following week for makeup CTs. These data included PIT Count start records (completed by volunteers when they began canvassing), tally records that contain observed counts submitted by volunteers throughout their time canvassing, and finish records (completed by volunteers when they were done canvassing). LAHSA provided the CT split associated with latitude & longitude coordinates (i.e. pin drops) for each tally submission, which USC incorporated in the overall cleaning and processing of this data. The process also incorporated data from the Akido Start survey data, which includes user-entered CT split assignments and team assignments, and Akido Finish survey data. Session IDs and team assignments were used to link sessions (e.g., when two members of the same team entered data for the same CT split) where the data should be combined. Other available data included records of where each deployment site was located and Deployment Site Coordinator Checkout Forms, which were paper forms associated with each volunteer team during the 3 nights of the PIT Count to record assigned CTs, whether all assigned CTs were fully counted, and whether there were any issues encountered on the field. Deployment Site Coordinators returned completed forms to LAHSA. Deployment Site Coordinators and LAHSA staff also reported known errors, and in many cases corrections, for specific CT splits or with specific volunteer teams. In order to combine these data sources and validate final PIT Count data, the following 4 steps were taken after the known corrections were applied and team sessions were linked:

1. Identify clean sessions: It was determined if there was a start and/or stop count record for any given CT split in the Akido app data and cross-referenced to see if geocoded tallies (pin drops) fell within the identified CT. If all pin drops fell within the identified CT, the record was determined to be a complete and valid entry for the given CT split.
2. Identify usable geocoded CT splits: If there were geocoded tallies outside of the CT split that was assigned, they were compared to the locations of Deployment Sites and to CT splits assigned to other volunteer teams during the three nights of the PIT. If it was their Deployment Site location, a CT split belonging to a different Deployment Site, or to another team's assigned CT split on the same PIT count night, the pin location was ignored, and the entry was assumed to belong to the assigned CT split. Some volunteers did not enter their observations into the app until they returned to the Deployment Site, and each CT split was assigned to only one team on the night of, so the pins matching one of these were assumed to belong to the assigned CT split, but entered outside the CT split, perhaps while driving back to the Deployment Site. When this assumption was in doubt, the Deployment Site Checkout Forms were used to confirm or reject it.

3. Multiple sessions for the same CT split: Some CT splits were represented in sessions both during the PIT count and during the make-up period. The earliest valid report was selected by default. If the sessions had very different counts, the Deployment Site Checkout Forms were used to determine if the observation from the night of confirmed its validity.
4. Assign zeros: If there were no tallies with the start/stop records, and the stop record or Deployment Site Checkout Form indicated complete coverage, zero counts were assigned. If there were no Akido sessions for a CT split, and the 2020 count was also zero, zero was assumed for 2022. When there was doubt about this assumption, e.g., the CT split was not covered by Collector app, Deployment Site Checkout Forms were checked to confirm that the CT split was assigned. Multiple CT splits were assigned to most teams, but the teams often only entered data for CT splits where they had visual counts to report.

Having reconciled these data, we next validated the counts via community review. For each SPA we developed maps showing CT splits with substantially increasing or declining counts from 2020 to 2022. We reviewed these maps and a list of specific CT splits where large changes were observed with local service providers and other key stakeholders in each SPA to confirm, or not, whether the changes aligned with their local knowledge. Both overall and the specific CT split list were reviewed. Most changes were explained and confirmed, but a few triggered a detailed review of the data from all sessions and the Collector app that applied to these areas. In the reviewed cases, there were specific overlapping sessions, e.g., both Collector app and Akido app coverage, that explained the discrepancy and corrections were made.

A final PIT Count data file incorporated these validated records.

SECTION 4: DEMOGRAPHIC SURVEY

The 2022 Demographic Survey (DS22) took place between December 10th, 2021 and March 18th, 2022 and covered 505 selected CTs across the CoC. A total of 6,426 surveys were collected during that time. A copy of the survey instrument can be found in Appendix A and Appendix B outlines the data collection protocols.

The purpose of the 2022 Demographic Survey was two-fold:

- 1) To collect data on a sample of homeless youth and adults to use in the estimation of unsheltered youth and adult homeless characteristics across the CoC; the City of Los Angeles; eight SPAs; the communities of Hollywood, Skid Row, and Venice⁴; five SDs; and 15 CDs.
- 2) To estimate the number of people living in the cars, vans, RVs, tents, and makeshift shelters (CVRM) captured in the PIT Count.

⁴ The communities of Skid Row, Venice, and Hollywood were labeled SPA 9, SPA 10, and SPA 11, respectively.

The sampling approach was kept similar to the approach used in the 2016-2020 Homeless Counts. Following the 2020 definition of geographic strata, the CoC was divided by CDs within the City of Los Angeles, and by SPAs outside the City of Los Angeles.

A 5% significance error was used to calculate a target sample size of surveys and 2020 average population estimates were used to define the final CT sample size.

4.1. Sample Selection

A two-stage stratified random sample was used for the DS22. In stage one, all CTs were allocated to different stratum and a random sample of CTs from each pre-defined strata was selected. In the second stage, selected CTs were covered by the survey team. Data collectors conducted surveys with any homeless person they could locate in a CT who agreed to participate. Data collectors visit the CT once or twice during the surveying period. Respondents were assumed to be selected at random from the homeless population in the CT.

CT sample selection probabilities were then used in the computation of analytic weights.

4.1.1. Strata Definition

The eligible CoC area to be surveyed consisted of 2,163 CTs. Each CT was allocated to one stratum within geographic and hotspot strata based on information from the HC20, Los Angeles County Homeless Outreach Portal (LA-HOP) data, HMIS Outreach data, demographic survey planning sessions and youth count planning sessions (also called focus groups) on population size, and hotspot designations received from LAHSA.

Geographic Strata

Geographic strata were defined using CD and SPA designations.

CTs were grouped into SPAs:

1. Antelope Valley
2. San Fernando Valley
3. San Gabriel Valley
4. Metro
5. West
6. South
7. East
8. South Bay

CTs were also grouped into the 15 CDs plus a larger geographic area not incorporated as one of the 15 CDs.

In general, CDs are smaller than SPAs and most of them include a portion of two or three different SPAs.

The geographic stratum was then defined by the combination of CDs and SPAs.

Table 1. Geographic Strata

CDs	SPAs
Non LA	1, 2, 3, 4, 5, 6, 7, 8
1	4, 6
2	2

8	6
9	4, 6
10	4, 5, 6
11	5
12	2
13	4
14	4
15	6, 8

[Note: Skid Row and Venice were covered with 100% probability and excluded from the strata definition above.]

Hotspot Strata

We define three types of strata:

- 1) Full Inclusion: These are CT hotspots to be surveyed with 100% certainty. Some small group of tracts, due to either having very distinct homeless population characteristics (e.g. Skid Row population) or hard to find homeless populations (e.g. families), were selected to be covered with certainty and excluded from the random sample selection. Included in this group of tracts are tracts with Family Solution Centers (FSCs), Youth Survey Sites⁵, safe parking locations⁶, as well as all tracts in Venice and Skid Row.
- 2) Hotspot: These are CTs identified as having higher concentrations of either homeless youth, homeless adults living in CVRTMs, or homeless adults living on the street. Each of these categories constituted separate strata for sample selection. The indicators were

⁵ Youth Survey Sites are community organizations where youth experiencing homelessness typically access service. The survey sites would typically expect to see at least 3 youth on any given day. Appendix D provides more detailed information on protocols regarding Youth Survey Sites.

⁶ Safe sleeping locations were added in 2022 in addition to safe parking locations that were added in 2020, to ensure they were surveyed in addition to the count of people using them being included in the visual PIT count and to improve data collection from those sleeping in vehicles. The two types of sites were grouped together. References to safe parking locations include safe sleeping locations as well.

created by comparing each CT’s estimated count with a cutoff based on the SPA population median and the CT’s deviation from it.⁷

- 3) Non-Hotspot: The remaining CTs are grouped in a category of its own.

Stratum	# of Tracts
Full Inclusion	103
Hotspot	991
Non-Hotspot	1,069

In prior years, LAHSA and USC coordinated a series of planning sessions in each SPA during the months of October and November where community partners engaged in outreach were asked to provide detailed information on homeless populations, including identifying their locations on a map of the LA CoC, and an estimate of the population sizes for individuals, families, youth and encampments separately. Additional descriptions of the area and best time of the day to find them was also gathered. For HC22, due to COVID-19 concerns partners were asked to submit this hotspot data via an online map and form created by LAHSA.⁸ This information was combined with recent LA-HOP and HMIS Outreach data to get an estimate of the homeless population at the CT level.

Compared to previous years, the attendance at these planning sessions was reduced. Relatedly, the number of hotspots submitted into the online planning maps and the estimated headcount were significantly reduced from previous years. This included a number of hotspot tracts from previous years with no reporting. It also included a number of 2020 non-hotspots with large reported counts. Given uncertainty about movement of unhoused individuals due to ongoing encampment clean-ups, concerns about the ability to provide up-to-date “ground truth” on hotspot locations during a pandemic, and concerns about the sparseness of the data, USC and LAHSA conducted a second series of SPA-level meetings in which community partners were asked specifically to address the reduced extent of reporting and the discrepancies between the 2020 data and the 2022 hotspot reports. These meetings affirmed a number of cases in which encampments had relocated or been cleared, possibly resulting in changes to the map. But they also confirmed that the number of hotspots identified might be underreported. Hotspot data collection was extended to allow for additional entries.

In light of these uncertainties about the coverage of planning session data, we modified the approach to coding hotspot status from previous years. We used the maximum count from the outreach count, the LAHOP count, and the planning session count as an estimate of homeless individuals in the tract. Homeless population estimates from HC20 were used as a second measure to identify hotspots. CTs with estimated populations above the cutoff by any of the two measures was tagged as a hotspot to be sampled.

⁷ A CT is assigned the hotspot status on one of the categories if the estimated number for that CT in that category falls above the SPA median plus the average absolute median deviation for the SPA.

⁸ LAHSA attended virtual SPA planning meetings and other planning meetings to train community partners on how to use the online form submission. Community partners were then instructed to input data on their own time before the submission period closed. A second period for youth hotspot data collection was opened in the first week of January.

As in HC20, safe parking locations and family services locations were incorporated into the sampling for the Demographic Survey. Capturing families was approached through a collaboration with Family Solution Centers identified by LAHSA. There were 8 FSCs total, 1 in each SPA that were involved in the HC22.⁹ CTs with FSCs were included in the Full Inclusion strata and sampled with 100% certainty. LAHSA and private stakeholders operate a handful of safe parking locations for homeless populations living in vehicles to spend the night. A comprehensive list of all active safe parking sites in the LA CoC area was also provided by LAHSA. Any CT with a safe parking site in it was included in the Full Inclusion stratum and sampled with 100% certainty.

Separate planning sessions were conducted to identify youth hotspots. Estimates from those sessions and from 2020 Youth Count (YC20) were used to classify CTs into hotspots and non-hotspots. Youth providers serving a significant number of youth (an average of five individuals on a given day) agreed to operate as survey sites and conduct surveys.¹⁰ Tracts holding those sites were part of the Full Inclusion stratum and covered with 100% certainty in the Demographic Survey sampling scheme. Different from the Youth Enumeration Survey used for the Youth Count, the Demographic Survey covered only a sample of youth hotspot tracts. Demographic Surveys were conducted at survey sites and youth who were captured on the street in CTs by USC trained data collectors.

Stratified sampling was done for CTs not identified for Full Inclusion, within the geographic strata. Non-hotspot tracts were assigned to their own stratum. Hotspot tracts were further stratified according to whether the planning sessions identified them as having youth, CVRTM, individuals, or combinations of these groups. A CT could only be allocated to one stratum for sampling purposes, so prioritization was established to assign CTs to mutually exclusive strata. The rules of assignment were:

- a. CTs identified as youth hotspot were assigned to the youth hotspot stratum.
- b. Any remaining CTs identified as containing a vehicle or encampment hotspot were assigned to the CVRTM stratum.
- c. Any remaining CTs identified as containing individual hotspots were assigned to the individual stratum.
- d. All remaining CTs that were not identified as hotspots were assigned to a non-hotspot stratum.

Table 2b shows the count of hotspot tracts under each category before the priority rule to clear the overlap was applied when tracts had more than one designation.

⁹ Staff at FSCs were trained and on-boarded by the start of demographic surveying in December by USC. However, due to Covid, fewer clients visited FSCs than in past years. FSCs also experienced staff turnover and absences, and one FSC moved during the data collection period. At least one FSC did not submit any surveys. For all these reasons, fewer family surveys were collected in 2022, and the estimated number of unsheltered families may under-represent their true size.

¹⁰ Youth Survey Sites were used for both the Demographic Survey and Youth Enumeration Survey. Demographic surveying at Youth Survey Sites took place after the week of Youth Count in February.

CVRTM HS: CVRTM Hotspot Indicator

[Note that not all geographic locations contain every type of hotspot.]

4.1.2. Sample Size

The total number of CTs to be sampled was defined using HC20 estimates. Using HC20 estimates, a 5% significance criteria was used to determine the HC22 sample size in terms of surveys for each geographically defined area.

The target sample size (in terms of CTs to be sampled) was estimated in two steps. Each CT was assigned a stratum defined by the 15 CDs and 8 SPAs. When hotspot strata and geographic strata were combined, a total of 92 strata were defined to be sampled (see Table 3). Note that hotspot stratum did not apply to Skid Row and Venice (SPAs 9 and 10), which were each represented with one stratum (Full Inclusion) to be covered with certainty (all CTs selected).

At this stage, 100% probability of selection was assigned to CTs in Skid Row and Venice (SPAs 9 and 10) and CTs having FSCs, Youth Survey Sites, or safe parking sites in them. These CTs were not included in the subsequent sampling steps.

The first step was to estimate the number of census tracts to be sampled using the average number of individuals per census tract in each geographic stratum.

Once the total number of CTs to be sampled from each geographic stratum was defined, the second step was to use Neyman proportional allocation to define the final number of tracts to be sampled from each hotspot/geographic stratum. Neyman allocation is an optimal allocation method that maximizes the precision of survey estimates by minimizing the variance of the mean estimator. Using this method, we obtained more precise estimates by determining the number of CTs to sample within each geographic area proportional to the product of the number of CTs per geography and the geography standard deviation. Using this sampling method meant we sampled more CTs from SPAs with a larger number of CTs or larger variability in CT homeless populations to account for heterogeneity in the homeless population within and across SPAs.

The number of CTs to sample was determined using the following formula:

$$n_h = n^* \left(\frac{N_h \sigma_h}{\sum_{i=1}^L N_i \sigma_i} \right)$$

In this equation:

n_h is the number of CTs to be sampled from HS stratum h

n is the total number of CTs to be sampled from the target geographic area

N_h is the number of CTs in HS stratum h

σ_h is the population standard deviation in HS stratum h (using 2020 adult homeless estimates)

L is the total number of HS strata in the target geographic area

¹¹ In the area defined by CD1 and SPA 6, CVRTM, INDIV, and NHS were combined for sampling.

¹² In the area defined by CD10 and SPA 6, CVRTM and INDIV were combined for sampling.

¹³ In the area defined by CD11 and SPA 5, CVRTM and INDIV were combined for sampling.

¹⁴ In the area defined by CD4 and SPAs 2, 4, and 11, CVRTM and INDIV were combined for sampling.

¹⁵ In the area defined by CD5 and SPAs 2 and 5, CVRTM and INDIV were combined for sampling. In the area defined by CD5 and SPA 4, CVRTM, YOUTH, and INDIV were combined.

¹⁶ One of the CVRTM CTs in CD 13 was originally designated as a Safe Parking site. After multiple surveys had been collected but before the USC survey teams visited the SP site, the location changed to CD 9. The original CT (192700) was kept in the sample and, since it was originally selected with certainty, retained a sample weight of 1.0. It should have been assigned to the CVRTM strata and is included in the count of CTs in that stratum here as selected. The rest of the CTs in the CD13 strata were sampled and assigned the appropriate sample weight.

	NHS	19	2		NHS	50	2	SKID ROW	FULL COV	4	4
								VENICE	FULL COV	11	11

The final sample size for each stratum was defined using the Neyman allocation function from SAS 9.4 (Neyman option in PROC SURVEYSELECT).

4.1.3. Selection of CTs

The number of CTs in each stratum within SPAs are shown in Table 3, along with the number of sampled CTs allocated to each stratum. After determining the number of CTs to be included in the sample within each stratum, a stratified random sample without replacement was drawn from hotspot and non-hotspot CTs. SAS PROC SURVEYSELECT was used to draw the sample. The randomly selected CTs were tagged for inclusion in the survey sample. Selection probabilities were automatically calculated for each area in SAS. A total of 505 CTs were included in the final sample.

Given the sparseness of the planning session data and the potential for encampment relocations between the sessions and the survey, we also anticipated the possibility that the sampling strategy would yield sample losses relative to previous years, raising the potential that we would not reach targets for maximum mean-squared error set out in the study plan. At the sampling and post-sampling stages, we took the following steps to address this concern

1. For some of the geographic areas representing the intersection of CD and SPA, the number of CTs in some of HS strata was low, and the geographic area was small. To reduce the number of CTs required to achieve the desired error we combined strata within geographic area, e.g., assigned all INDIV and CVRTM CTs as one stratum. In most of these places planning sessions indicated that they could be assigned multiple types of hotspots in the priority list, i.e., the CTs were relatively similar across the combined strata. Reducing the number of separate strata in these geographic areas allowed sampling at higher rates where the HS information was sparser and the geographic areas larger. Combined strata are noted in Table 3.

¹⁷ In the area defined by CD15 and SPA6, CVRTM, YOUTH, and INDIV were combined for sampling.

¹⁸ In SPA 1 there were several CTs identified as dangerous for our survey teams, due to illegal marijuana grows present there. We reviewed CTs selected in SPA 1 with local service providers to screen these areas out. When a dangerous CT was selected, we simply re-selected a replacement CT in the same stratum from among the remaining unselected CTs.

2. We ran a range of samples applying Neyman allocation with different margin of error (MOE) targets. We used these to simulate the likely survey yield based on observed data on canvassed individuals and non-response in DS2020. Based on this, we identified SPA/CD combinations with higher levels of risk of low sample size and high error. Combining these estimates with our knowledge of SPAs where planning session data may have been incomplete, we sampled at a higher rate in those SPAs. Specifically, we sampled at higher rates in SPA 1, SPA 3, and CD 4, resulting in 2, 5, and 2 additional CTs, respectively, being selected in these geographic areas. The target MOE was 0.05 for SPA 1, 0.055 for SPA 3 and CD4, and 0.06 for all other geographies.
3. Throughout the course of fieldwork, the data management / sampling team met regularly with the field team to discuss the survey yield relative to expectations/necessary targets and the frequency at which tracts were yielding zero counts, particularly in hotspot tracts. While we were prepared to develop a strategy for augmenting our sample or resampling based on these assessments, in the end we determined that samples in most areas would achieve tolerable MSE targets. After the PIT count was complete, we used the observed counts from the PIT to target CTs where we saw large counts and few surveys to be re-canvassed.

4.1.4. Sample of Individuals

The second stage of sampling for the DS22 was assumed to be a random selection of people experiencing homelessness within selected CTs.

Data collectors canvassed each selected sample CT in its entirety once or twice during the surveying period and conducted surveys with any individual experiencing homelessness they could locate in the CT who agreed to participate in the survey.¹⁹ Respondents were assumed to be selected at random (temporally) from the homeless population in the CT, and data collectors went to great lengths to locate homeless individuals in difficult terrain. Non-response and unapproachable individuals were recorded and factored into the final analytic weights.

4.2. Sample Weights

Sample weights were constructed for use with the DS22 data. Strata sample weights were calculated by taking the inverse of the probability of CT selection within each stratum. Several strata were assigned 100% probability of selection (see Table 3).²⁰

¹⁹ The survey team made an exception on Skid Row due to its high homeless population density. The team spread out through the tract and conducted 12 to 15 surveys each with individuals randomly selected, at which point they stopped interviewing.

²⁰ After the sample of tracts was drawn and the surveying had started, there were several changes required to account for FSC and Safe Parking site moves. An FSC in SPA 7 moved to a new location. The new locations had been an unsampled NHS CT. Data had not been collected from the old location, which would have been in the CVRTM stratum. The old CT was dropped from the sample and the new one added. The CVRTM and NHS sampling weights were adjusted to account for having one more and less CT in the pool, respectively. Similarly, three Safe Parking sites changed locations during the count in SPAs 4 and 6. In one case surveys had already been collected in the CT, but not at the Safe Parking site which then moved; in this case the CT was kept in the sample with its original sample weight (1.0), but its stratum was changed to CVRTM. In the other cases data collection at the old site had not been collected, so the old location CT was dropped and the new one added, with changes to the sample weights for the selected CTs remaining, in the same way the FSC adjustment was done.

Final weights were constructed during the data analysis process (see Section 8).

SECTION 5: YOUTH ENUMERATION SURVEY

Because homeless youth are considered a “hidden population” that may not be easily discernable through a visual count, best practice recommendations include employing a survey-based method when conducting homeless youth counts. Since its inception in 2016, the Annual Los Angeles County Homeless Count of unsheltered youth has implemented a survey-based methodology in which a single survey instrument was used to both enumerate and to describe the characteristics of youth experiencing literal homelessness.

As noted in the HC20 methodological report, however, significant changes were made to the data collection and subsequent analysis of the Youth Count (YC) based on youth provider feedback who are primarily responsible for conducting the YC. Because data collection for the youth survey is largely dependent on the capacity of youth service provider staff and their volunteer networks, youth service providers historically have faced significant challenges in covering all sampled CTs over the 10-day Youth Count period. The length of the survey, which included potentially triggering questions, was identified as a significant hindrance to the process, limiting the capacity to survey all potential youth.²¹

To address these concerns, USC implemented a change in the Youth Count methodology in 2020, namely the introduction of the Youth Enumeration Survey, a shortened version of the Youth Survey used in prior years. The new survey collects information on demographic characteristics and household compositions and was administered during the 10-day Youth Count period, which was intended to both reduced provider burden and improved the accuracy of the count. A longer survey (the former Youth Survey) was integrated with the Demographic Survey and administered by USC survey teams over the same three-month period in which the demographic survey is normally conducted. The Demographic Survey for youth was used to provide descriptions of subpopulations, such as veterans and chronic households.

The purpose of the 2022 Youth Enumeration Survey (YS22), therefore, was to count the youth (under age 25) homeless population in the CoC area and estimate its size, serving as a PIT Count of youth. A detailed description of this population, however, was estimated through the Demographic Survey as described under Section 4.

In previous YCs, surveys were conducted in a sample of CTs across the CoC and took place over a 10-day period;²² for YC22 this was delayed from the end of January to the end of February due to an increase in infection rates of COVID-19 just before the regularly scheduled January period. The data collection period was also extended two weeks to complete coverage of all sampled CTs.

²¹ In 2019, surveyors spent approximately 30-45 minutes to complete the survey.

²² HUD requires all CoCs to conduct point-in-time counts within a 10-day period in January. Due to Covid, HUD allowed CoCs to delay the count to February instead. YS22 data collection began February 22, 2022 and ended March 15, 2022.

COVID-19 not only presented health concerns but also impacted the youth service providers capacities in significant ways. Many youth providers and survey sites experienced COVID-19 outbreaks during the planning periods and leading up to data collection. Key staff members were infected throughout these periods and some sites were fully shut down and quarantined by the Department of Public Health. Organizations experienced inconsistencies in staffing, reduced volunteer support, limitations in the number of staff available to participate in the YC, as well as reports of significant burnout of front-line workers. The ability to provide services to youth was greatly impacted by these factors, which also affected participation and, in some cases, a de-prioritization for YC22 planning and execution. Youth service providers are not provided any additional resources or funding for their staff participation in the YC, so many staff are assigned these YC responsibilities in addition to their normal job responsibilities.

All CTs in Los Angeles County were assigned to a stratum, determined by hotspot and geographic designations (SPA and CD). Generally, CTs in hotspot strata, were sampled with certainty, while CTs in other strata were selected using a random sampling approach. In select hotspot CTs, youth service providers serving a large number of youth²³ were designated as Survey Sites (referred to as Access Points in some prior years). The protocol called for all potentially eligible youth who visited the site during Youth Count to be interviewed, along with any other unsheltered youth that were encountered elsewhere in the CT, outside the facility. In the selected non-Survey Site CTs, surveyors were also instructed to interview all unsheltered youth encountered.

A total of 610 (315 eligible) surveys were collected for YC22.

Youth Count efforts employed two types of location-based data collection strategies: 1) street survey teams and 2) survey sites.

- 1) Street survey teams: Teams assigned and coordinated to conduct surveys in selected CTs.
- 2) Survey Sites: SS coordinators agreed to provide staffing resources to assist in survey data collection ranging from two to ten days. Note that the entire CT in which the SS's are located were also covered geographically by street survey teams.

Youth Enumeration Survey collection happened in two timeframes: 1) blitz days and 2) extended time periods.

1. Blitz Days: In all eight SPAs, USC supported a blitz day model in which youth homelessness provider organizations dedicated resources (i.e. staff, volunteers, transportation) to canvas the entire geography of the selected CTs and conduct as many surveys with homeless youth as possible on the predetermined day (or days). USC and Lens Co's resources were dedicated to supporting each SPA on their designated blitz day.

Each SPA blitz day, USC survey teams were assigned CTs that were identified by SPA leads as being more difficult for the providers to cover themselves. USC teams were deployed independently. Lens Co also oversaw the recruitment and management of

²³ Providers serving an average of five homeless youth per day qualified as Survey Sites.

volunteers to support SPA blitz days as well as cover CTs in SPAs that historically had difficulties in coverage and capacity. Many of these volunteers were LA County employees.

Youth homelessness provider organizations and their volunteers assembled street survey teams who canvassed CTs that were identified in the sampling strategy. During the blitz days, street survey teams prioritized CTs that were identified as including hotspots in which homeless youth were expected to be found. Additionally, hotspot data was used to strategize the times (morning, afternoon, evening) that street teams canvassed CTs.

2. Extended time periods: As youth homelessness providers did not have the capacity to canvas all CTs included as part of the Youth Count sample during blitz days, street survey teams covered any remaining CTs during an extended time period. This included non-hotspot CTs and CTs that required specialized deployment such as those with unique geography (i.e. mountains, airports, riverbeds) or large geographic coverage.

YC data collection was extended to a 20-day period (approved by HUD) to alleviate capacity constraints. Although, youth providers were strongly encouraged to finish CT coverage in the first 10 days, the additional data collection period provided flexibility where there were unexpected events or if providers were having difficulties. Providers were instructed to prioritize coverage of hotspot CTs, and if necessary CTs that were non-hotspots could be covered in the additional days.

A copy of the survey instrument can be found in Appendix C and Appendix D outlines the data collection protocols with more detail.

5.1. Sample Selection

The youth count sampling methodology follows the approach from the previous four years. A stratified random sample of CTs was selected from a list of CTs in the CoC, their geographic classification, the identification of hotspots from focus groups planning sessions, and the count from the previous year. Outreach data from HMIS was also incorporated. The geographic stratum was defined using a combination of CDs and SPAs (for areas outside of CDs).

Similar to the demographic survey, the sample size was set based on a preliminary analysis of standard errors. The target was to get a probability sample with a 5% significance level for the youth count at the CoC, the SPA/CD level. For the youth enumeration, the significance and precision levels target the main measure from the survey, the count of homeless youth.

In order to extract the sample, an additional strata level was added to divide CD/hotspot areas that cover more than one SPA, and the pre-identified sample size for that CD area was divided into SPA stratum proportionally. A stratified random sample of CTs were selected, where each CD/SPA defines a separate geographic stratum and additional strata were defined by the identification of hotspots.

5.1.1. Strata Definition

The first step was to define two sets of strata, a geographic stratum and hotspot stratum.

Geographic strata in the YS22 was defined as in the DS22 (see Section 4.1.). CTs were classified into three types of strata depending on their hotspot status:

- 1) Full Inclusion: These are CTs that include Youth Survey Sites (SS HS) and planning session hotspots (FG HS) to be surveyed with 100% certainty.
- 2) Hotspot: These are CTs that are identified as youth hotspots from historical data (HIST HS) and constitutes a separate stratum.²⁴
- 3) Non-Hotspot: The remaining CTs are grouped in a category of its own (NHS).

For the Youth Enumeration Survey, hotspots identified by focus groups during planning sessions (and enhanced with recent HMIS Outreach counts) were included in the Full Inclusion tract category. Historical hotspot tracts were also identified using data from HC20 and constituted a stratum of its own.

Hotspot data was collected via an online ArcGIS form. When the form was opened for data collection, the LAHSA data team attended virtual SPA planning meetings and other YC meetings to demonstrate how to use the online form submission as well as answer any potential questions. Community partners were then instructed to input data on their own time before the submission period closed. Partners were continuously reminded about the importance of the data and submission period. Youth providers were encouraged to collaborate with young people who were experiencing homelessness to input hotspots that they were aware of, and USC provided \$10 gift cards to compensate their participation. For the youth count, submissions and participation were relatively low. A second period for hotspot data collection was opened in the first week of January to help to account for changes in hotspot areas.²⁵

LAHSA provided USC with results from all of these sources, data from focus groups, 2020 youth count, and youth outreach counts (from HMIS). Hotspots were identified using the same approach used for the demographic survey, i.e. based on population estimates. Additionally, CTs with Youth Survey Sites were also tagged. These categories constituted separate strata for sample selection and were included in the Full Inclusion category. Following previous years counts, additional strata were defined using YC20 to identify historical hotspots (HIST HS)²⁶, included as a hotspot group to be sampled.

²⁴ A CT is assigned the hotspot status of one of the categories if the estimated number for that CT in that category falls above the SPA median plus the average absolute median deviation for the SPA.

²⁵ In 2020, a new hotspot quality assurance process was implemented to improve the quality & accuracy of hotspot data. Youth providers were asked in early January to confirm previously identified hotspots, update any notable location or time of day information, and to identify any new hotspots.

²⁶ The count of Youth Enumeration surveys collected in 2020 was combined with the youth observed during the 2020 PIT count. The Youth Enumeration survey was only conducted in selected CTs while the PIT count covered all CTs.

Table 4. Number of CTs by Hotspot Indicator

SS HS	Not FG HS		FG HS	
	Not HIST HS	HIST HS	Not HIST HS	HIST HS
No	1,761	223	128	36
Yes	2	7	0	6

SS HS: Survey Site Hotspot Indicator (sampled with 100% certainty)
 FG HS: Focus Group Hotspot Indicator (sampled with 100% certainty)
 HIST HS: Historical Hotspot Indicator (YC20)

The remaining CTs not identified with these categories were assigned to the non-hotspot category. Hotspot strata were defined in order of priority (SS, FG, HIST HS). Each SPA could have contained up to three hotspot strata, with the exception of SPAs 9 and 10, which were included in the Full Inclusion category of tracts and sampled with 100% probability.

5.1.2. Sample Size

The total number of CTs to be sampled was based on an estimate of tracts needed to reach a 5% significance level in the count of homeless youth and using the 2020 homeless youth count.

The approach to identify the number of tracts to sample from each stratum for the YS22 was the same as the one used for the DS22 (see Section 4.1.2).

5.1.3. Selection of CTs and Count of Homeless Youth

After determining the number of CTs to be sampled from each stratum, a random sampling without replacement was used to draw the final sample of 437 CTs. SAS PROC SURVEYSELECT was used to select CTs. The randomly selected CTs were tagged for inclusion in the survey sample. Selection probabilities were automatically calculated for each area by SAS.

Table 5. YC22 CT Sample Size By Stratum²⁷

Geography	HS Strata	Number of Tracts	Sample Size	Geography	HS Strata	Number of Tracts	Sample Size	Geography	HS Strata	Number of Tracts	Sample Size
CD 1	HIST HS	9	4	CD 9	HIST HS	2	2	SPA 1 Non-LA	HIST HS	10	4
	NHS	53	8		NHS	49	5		NHS	63	6
	PS HS	8	8		PS HS	10	10		PS HS	9	8
CD 2	HIST HS	9	4	CD 10	SS HS	1	1	SPA 2 Non-LA	SS HS	2	2
	NHS	43	5		HIST HS	3	3		HIST HS	6	2
	PS HS	15	15		NHS	66	8		NHS	104	8
	SS HS	1	1		PS HS	1	1		PS HS	4	4

²⁷ Some selected CTs in SPA 1 were identified as dangerous due to illegal marijuana grows (911001, 980003 and 900300, from PS HS, NHS, and NHS, respectively). CTs from the NHS stratum were replaced with newly sampled ones. Several additional CTs were added as FG HS after the count had started; these were CTs where youth could be found but which were not identified during hotspot planning (910201, 910501, 910602, 910208, 910705, 920030, 920337, 402404, 550300, 502200, 500300, 553000, 501900 were originally assigned to the HIST HS NHS strata).

CD 3	HIST HS	2	2	CD 11	SS HS	1	1	SPA 3 Non-LA	HIST HS	25	3
	NHS	55	7		HIST HS	5	2		NHS	307	8

		SS HS	1	1	PS HS		4		4	PS HS	9
					SS HS	1	1		SS HS	2	2

5.2. Sample Weights

Sample weights were constructed for use with the YS22 survey data. Strata sample weights were calculated by taking the inverse of the probability of CT selection within each stratum. Several strata were assigned 100% probability of selection. Final weights were constructed during the data analysis process (see Section 7).

SECTION 6: PRODUCING ESTIMATES FOR 2022 SHELTER COUNT

6.1. Overview of Point-in-Time Shelter Count

Shelter count estimates were generated using the PIT shelter count. LAHSA conducted a PIT shelter count that is a 100% enumeration of all shelters in the CoC; therefore, there is no sampling or sampling error. The shelter PIT Count provides the raw number of homeless individuals living in the following shelter types: emergency shelters (ES), transitional housing (TH), and safe havens (SH), including those receiving vouchers for hotels or motels provided by these shelters. For HC22, 19,233 individuals and 12,817 households were counted during the shelter PIT Count.

6.2. Homeless Management Information System Data

Subpopulation and demographic estimates were estimated using HMIS data. Complete HMIS records from December 1, 2021 to December 31, 2021²⁸ with demographic characteristics were used to derive the distribution of demographic and subpopulation characteristics for the sheltered homeless population. Following prior years, HMIS data were assumed to be a complete enumeration of the sheltered population; therefore, additional weighting was not required to generate demographic and subpopulation estimates.²⁹ After deduplication³⁰ and screening for those using shelter services in December, 14,437 individuals in 11,846 households were included for analysis.

6.3. Data Analysis

After deduplication and screening for December shelter use, demographic characteristics and subpopulation estimates were generated by estimating the proportion within the HMIS data for each type of shelter (ES, TH, SH) and household type (i.e., individuals, adult and transition age youth (TAY) families, and veterans). This proportion was then applied to the analogous PIT shelter household and individual counts, by household and shelter type, to obtain their characteristics (see Appendix E). Because the CoC is large and diverse, the subpopulation estimates were applied at the SPA level to SPA-specific counts, and then summed to get the CoC result.³¹ For example, if we wanted to estimate the number of sheltered adult women in households without children, we would begin with the shelter PIT Count for all individuals in households without children by shelter type (ES, TH, SH) and by SPA. We then would estimate the proportion of women (and other genders) in individual households from each shelter type for each SPA using the HMIS demographic data. We then apply the estimated proportions to the counts by household type, shelter type, and SPA to obtain estimated counts of women in households without children. To estimate the total number of women in the CoC, we sum the estimated counts across household type, shelter type, and SPA. In general, total CoC estimates of subpopulations were generated by first summing the counts, estimating the proportions and

²⁸ HMIS data were extracted based on entry, exit, and service dates. Note that program entry, update, exit, and end dates were used to verify that individuals were actually sheltered in December 2021. For emergency shelter records only, bed service dates were also referenced. For records with missing program exit or end dates, a cut-off criteria using program entry and update dates was used to identify relevant records. For transitional housing and safe haven records, only records with program entry or update dates within 2 years of December 2021 were included. For emergency shelter records, only records with program entry, bed, or update dates within 180 days of December 2021 were included.

²⁹ Note that some shelters do not report to HMIS either because they do not receive funding from LAHSA or for confidentiality purposes (domestic violence (DV) shelters); however, LAHSA collects count data separately from these shelters to include in the shelter PIT count. Therefore, the HMIS data are a total enumeration of all shelters that contribute to the HMIS system. By applying the HMIS data to the non-HMIS providers and DV shelters, we implicitly assumed that the distribution of characteristics in the HMIS shelters were the same as those in the non-HMIS and DV shelters. Also note veterans are overrepresented in the HMIS population; however, this only poses a problem if the characteristics of veteran families in the HMIS data are different compared to non-HMIS veteran providers.

³⁰ Note that several duplicates occurred in the HMIS data, partially stemming from what appeared to be individuals moving from shelter to shelter. Our deduplication process used birthdate, gender, ethnicity, race, and veteran status to eliminate most duplicates.

³¹ CoC-wide proportions were applied for select geographic areas or subgroups, such as veterans and unaccompanied minors, with small sample sizes.

applying them to the counts, and then summing across all shelter and household types, by SPA.³² See Appendix F for the HC22 shelter count results.

We used SAS version 9.4 (TS1M3), a statistical software package for these estimations.

SECTION 7: PRODUCING ESTIMATES FOR 2022 UNSHELTERED HOMELESS COUNT

7.1. Unsheltered Adult Count

The unsheltered adult count (street) estimates were also generated from two distinct sets of data: the PIT street count and the Demographic Surveys from adults (25 or older). Because the PIT street count was a 100% enumeration of all CTs, these data provide the total population counts for all individuals observed sleeping outside and all cars, vans, RVs, tents, and make-shift shelters.³³ The counts for individuals on the street are provided by estimated age category (under 18, 18 to 24, and over 24), with families counted separately from individuals. The unsheltered adult analysis includes the counts of individuals 25 and over on the street, family units and member counts, vehicles, tents, and make-shift shelters. Each individual, family unit, vehicle, tent, and make-shift shelter is considered a household.

To estimate the number of homeless individuals classified within each of the desired demographic and subpopulation categories, USC administered a survey to a sample of the unsheltered adult homeless population (see Section 4 for information on the survey design). After deduplication, 3,887 eligible³⁴ surveys, each representing a household, reporting on 4,097 individuals, were used to estimate demographic and subpopulation estimates. A methodology like the one used for the shelter count was employed to estimate the proportion within each household type (adults with children, adults without children, veterans without children, and veterans with children) with specific demographic and subpopulation characteristics. These proportions were then applied to their respective PIT population totals (see Appendix E). The proportions and their application were done by SPA and summed across SPAs³⁵ to derive the estimated subpopulation counts for the CoC.

We used weights to estimate proportions from the survey data to account for the sampling method. Sample weights were calculated as the inverse of the probability of CT selection within each stratum (see Section 4). The sample weights were adjusted for non-response and post-

³² For smaller geographies, descriptive proportions were estimated by the appropriate geographic units, calibrated to preserve totals produced by the SPA-based CoC counts.

³³ As mentioned in Section 3, this year, 12,413 individuals, 28 family units with 111 members, and 21,965 uninhabitable dwellings were counted during the unsheltered PIT Count. This includes 289 individuals and 1 family units with 5 members that were counted in safe parking locations.

³⁴ Eligibility was determined by age and housing status. Housing status eligibility follows the HUD-definition of literal homelessness, i.e., sleeping in places not meant for human habitation. Eligibility for the demographic survey also excludes those staying in interim housing, that is, emergency shelters, transitional housing, and safe havens, as they are covered by the shelter counts.

³⁵ For smaller geographies, PIT counts and descriptive proportions were estimated by the appropriate geographic units, calibrated to preserve totals produced by the SPA-based CoC counts.

stratified to the household PIT Count³⁶. All demographic and subpopulation estimate standard errors were adjusted for the survey sampling design, using PROC SURVEYMEANS in SAS.

7.2. Unsheltered Youth Count

In comparison to unsheltered adults, unsheltered homeless youth are harder to measure because they are considered to be a hidden population with unique barriers such as youth often being located in inconspicuous areas. Therefore, a sampling enumeration framework (see Section 5) was used to estimate the unsheltered youth count for youth-headed families, unaccompanied TAY (aged 18–24), and minors. As in HC20, the estimated unsheltered youth count was derived from the Youth Enumeration Survey that included eligibility, demographic information (age, gender, ethnicity, race, and sexual orientation), and household composition. A separate long survey, similar to the single survey conducted in previous years, was integrated with the adult Demographic Survey, and youth responses were used to estimate subpopulation characteristics such as veteran status, health conditions, and domestic violence experience. The long survey also included questions regarding demographic characteristics and household composition. The Demographic Survey sampling included a youth stratum identified through the youth hotspot planning sessions.

For enumeration, 610 Youth Enumeration Surveys were collected. After deduplication, 315 eligible³⁷ youth surveys reporting 332 individuals were used to estimate the youth street count. For subpopulation description, 189 Demographic Surveys were conducted with youth, with 186 deduplicated eligible surveys reporting on 205 individuals. Total, demographic, and subpopulation counts were calculated from the youth surveys by household type (i.e., unaccompanied TAY and minors and parenting youth) using a similar method to the unsheltered adult count (see Appendix E). The main difference in the methodology between the youth and adult unsheltered counts is that the adult unsheltered count is based on the PIT Count of individuals and CVRTM with complete coverage of the CoC while the youth count is based on Youth Enumeration Surveys conducted in a sample of CTs, which means that the sampling weights played a greater role in determining the number of unsheltered homeless youth.

Youth sampling weights were calculated for the enumeration survey as the inverse of the probability of selection (see Section 5). The sampling weight was then adjusted for unit non-response using similar methods to those used for the demographic survey, i.e., using a nearest neighbor approach to distribute non-responding individuals' weights based on interviewer-perceived characteristics. Unlike the adult street count, the Youth PIT Count used a sampling enumeration; therefore, weights were not scaled to actual population counts. Specifically, each

³⁶ We collected interviewer-perceived age, gender, race, ethnicity, and presence of serious mental illness, physical disability, or substance abuse for all potential respondents. Non-response (NR) was observed if the subject was not approached, refused or declined to give consent, or did not provide eligibility information (age and housing status). For each point of non-response, we distributed the weight of NR individuals to responding ones using a nearest neighbor approach. Based on predicted values from logistic regressions of response on the perceived characteristics, we distributed the weight for each NR individual to those with similar predicted values. We then post-stratified the weights of the eligible respondents to the number of households observed in the PIT count (individuals, family units, vehicles, tents, and make-shift shelters) by stratum.

³⁷ Eligibility was determined by age (respondent must be less than 25 years old and without anyone 25 or older in the household) and housing status.

individual identified in the enumeration survey, i.e., the respondent and household members, was multiplied by the non-response adjusted sample weight, which approximates the total number of people in the youth population that the survey respondent represented. The total youth homeless population was calculated by summing these products.

Specifically,

$$Y = \sum_{i=1}^n P_{is} * W_s, \text{ and} \\ P_{is} = R_{is} + h_{is}$$

where Y is the total youth estimate; P_{is} is the size of household i , including respondent R_i , with household members h_i , in strata s ; and W_s is the non-response adjusted weight W for strata s . The total estimated unsheltered youth population, summed over all strata, is 1,028. The Demographic Survey weights were adjusted for non-response within the process applied to the adult demographic survey, with the youth weights separated from the adult weights when they were post-stratified to the estimated Youth PIT Count and final jackknife weights were produced.

The enumeration survey was used to estimate basic demographic characteristics by household type and SPA, and the demographic survey produced the subpopulation proportions by household type and SPA³⁸, similar to the method used for the unsheltered adults.³⁹ The standard error for the estimated counts and subpopulations were adjusted for the survey sampling design, using PROC SURVEYMEANS in SAS.

7.3. Uninhabitable Dwelling Conversion Factors

The number of dwellings not meant for human habitation were counted during the adult PIT street count and used to estimate the number of individuals living within these types of dwellings, that is, cars, vans, RVs, tents, and make-shift shelters. As was done in 2020, the methodology in 2022 included the following: 1) the standard errors of the CVRTM population estimates were incorporated; 2) estimation was done at the SPA level to better reflect differences in the population across the county; and 3) adjustments were made to account for youth (under 25 years old) in CVRTM. The estimates of people living in CVRTM continue to rely on questions in the Demographic Survey that asked whether respondents slept in any CVRTM in the last six months, and if so, to provide the number of people⁴⁰ they stayed with, within any of the uninhabitable dwelling types. Those who reported living in any CVRTM last night or for most of the last 30 days are included in this group. Separate samples were constructed for each of the CVRTM and their non-response adjusted weights were post-stratified to the PIT Counts for each type of dwelling by SPA. The non-response adjusted post-stratified weights were summed by

³⁸ For smaller geographies, enumeration estimates and descriptive proportions were estimated by the appropriate geographic units, calibrated to preserve totals produced by the SPA-based CoC counts.

³⁹ The enumeration and demographic surveys' demographic characteristics and household types were compared to ensure that the samples had similar distributions. For all demographic and household measures, the estimates were not significantly different at the 95% confidence level.

⁴⁰ Note that this number was top coded to a maximum of 10 people to control for outliers.

SPA and household type using PROC SURVEYMEANS in SAS to produce population estimates for each type of dwelling, along with the standard error of the sums. The estimated individual adult CVRTM counts were then adjusted by subtracting the sum of weights for youth who reported sleeping in CVRTM either most of the last 30 days or last night to produce the final estimates that adjust for their presence on the night of the PIT Count. In 2020, and continued in 2022, an additional change was implemented to allocate the CoC-level estimate of families across all SPAs by the SPA share of each CVRTM; in 2019, family estimates were assigned to the SPA where family surveys were collected.⁴¹ For geographies other than CoC and SPA, the estimated SPA counts were distributed according to the geographic unit's share of each CVRTM within the SPA⁴². The CVRTM population estimates and their standard errors were carried forward to the descriptive analysis of unsheltered adult subpopulations. In the past, distinct conversion factors were calculated for each type of dwelling at the CoC level, including the percentage of family households and the mean number of people in each dwelling type by household type. Though this method was not used in HC22, we have calculated conversion factors that will, when applied to the appropriate PIT Counts of CVRTM, produce the final population estimates at the CoC level.⁴³ For comparison to prior years, these are presented in Table 6.

Type of household	Dwelling Type	Number	Mean Count per Dwelling	Proportion of Dwellings
Individuals	Car	3,209	1.285	95.32%
	Van	2,287	1.342	98.17%
	RV/camper	7,042	1.563	98.11%
	Tent	4,296	1.320	99.81%
	Makeshift shelter	4,768	1.504	99.62%
Families	Car	158	3.245	4.68%
	Van	43	3.107	1.83%
	RV/camper	136	4.088	1.89%
	Tent	8	3.424	0.19%
	Makeshift shelter	18	3.000	0.38%

⁴¹ Family estimates were spread across the CoC for two reasons: 1) the data collection was uneven across SPAs, with SPA 6 accounting for nearly half of all family surveys, and 2) generally the number of family surveys is small (N=166 with any CVRTM) relative to surveys from individuals.

⁴² In 2019, the CVRTM counts for geographies besides CoC and SPA were estimated by summing weights within each geography. As the weights were post-stratified by SPA, the sum across the geographic units resulted in the CoC count, but the standard errors were large and the estimates more volatile year-over-year.

⁴³ For families, the CoC-level multipliers applied to CVRTM counts will produce estimates for all geographies that match those reported. For individuals, application of SPA-level multipliers, which have also been calculated, to CVRTM not designated as family-occupied will accurately produce estimates that match those reported.

7.4. Annualized Estimates

Consistent with HC17-HC20, we used a formula modified from Burt and Wilkins (2005) to calculate the annualized estimates. Specifically, Burt and Wilkins (2005) asserted that annualized estimates in an area should be calculated as:

$$\text{Annual Estimate} = A + ((B * 51) * (1 - C))$$

where:

A = PIT Count of currently homeless (CH) people, including adults and children

B = Number of CH adults and children who (1) became homeless during the last 7 days, whether for the first time or not, or (2) were already homeless but just entered the boundaries of the community during the past 7 days

C = Proportion of CH adults and children in A who had a previous homeless episode during the past 12 months

However, this formula does not account for the calculation of estimates by subpopulation. To account for subpopulation estimates, following HC18, we revised Burt and Wilkins' (2005) formula to the following equation for subgroup g:

$$\text{Annual Estimate}_g = PP_j * [A_g(1 + ((S_g * 51) * (1 - C_g)))]$$

where:

A_g = PIT Count for subgroup g at the CoC level

S_g = Proportion of homeless individuals during the last 7 days, or homeless individuals who entered the area during the past 7 days for subgroup g at the CoC level

C_g = Proportion of individuals who had a previous homeless spell in the past 12 months for subgroup g at the CoC level

PP_j = Ratio of jurisdiction j's total estimated PIT Count relative to the estimated CoC population

As an illustration, we calculated the following CoC annualized estimates for the following subgroup g:

Table 7. Annualized Estimates by Subgroup				
Subgroup (g)	A _g	S _g	C _g	Annualized _g
Total	65,111			97,603
Sheltered adults	17,439	0.0113	0.4438	23,009
Sheltered youth	1,794	0.0221	0.4314	2,944
Unsheltered adults	44,850	0.0112	0.0333	69,511
Unsheltered youth	1,028	0.0221	0.0430	2,139

This method takes into consideration the proportion of newly homeless individuals each week (S) and assumes that this flow (proportion) of newly homeless is constant each week of the year, except for the week of the PIT Count, which is why it was multiplied by 51 weeks. This number was then adjusted for duplicates by multiplying it by the proportion of people who had not been previously homeless in the past year (1-C). This helped to ensure that this proportion represented only participants who had new spells of homelessness or were new to the area. The 52nd week of the year was captured by the current homeless count, represented by the PIT Count (A). It was

also assumed that this number represented the stock of people experiencing homelessness in a week. Therefore, to determine the number of newly homeless individuals in the remaining 51 weeks of the year, this number was multiplied by 51 weeks and adjusted by the duplicate adjusted flow (proportion) of newly homeless individuals as previously described. All estimated proportions for the unsheltered were weighted to generate population estimates.

It should be noted that because estimates were unstable at jurisdiction levels smaller than the CoC, we used a proportional allocation. Therefore, to allocate annualized estimates to jurisdictions smaller than the CoC, the proportion of the jurisdiction total estimated PIT Count relative to that of the CoC was applied to the CoC annualized estimate.

7.5. Subpopulation Estimates and SE

Standard errors were calculated to determine the precision of the estimates. Standard errors were calculated taking into consideration the sampling method and the complex interactions required to calculate the estimates. Standard errors were estimated using Jackknife variance estimation. As in previous years, the standard error calculations assumed the shelter counts and demographic characteristics, and the unsheltered adult PIT Count were measured without error; therefore, they were assumed to contain no error. Beginning in 2019 and continued through 2022, the standard errors of the CVRTM estimated population were incorporated into the final estimates of error, i.e., treated as an estimated count. A breakdown of the standard error calculations is as follows:

1. If the estimate was derived by multiplying a count (N) by an estimated proportion (pp), for a particular subpopulation group (g), then the standard error was calculated as:

$$Se_g = N * se_{g,pp}$$

In this equation, $se_{g,pp}$ is the standard error of the proportion for subpopulation g. Note that for adult street count estimates, individuals and families were estimated separately. All individuals were assumed to be aged or 25 or older; therefore, no measurement error existed (i.e., we did not have to estimate percentage age categories for this group). However, for households with children, separate counts were calculated for individuals under age 18, TAY between the ages of 18 and 24, and members aged 25 or older. Because these age percentages had to be estimated from the demographic survey, they were estimated with error. Therefore, standard errors were calculated as previously described.

2. If the estimate was derived from an estimated count (n) multiplied by an estimated proportion (pp) for a particular subgroup (i), then the standard error was calculated as:

$$se_g = \sqrt{se_n^2 * se_{g,pp}^2 + pp_g^2 * n^2 * \left(\left[\frac{se_{g,pp}^2}{pp_g^2} \right] + \left[\frac{se_n^2}{n^2} \right] \right)}$$

Notice that if there was no standard error for the count, this equation reduces to the prior equation.

3. If the estimate was derived by summing across samples (e.g., unsheltered female youth plus unsheltered female adults) and data sources (e.g., sheltered and unsheltered women) then the standard errors were calculated as simply the square root of the sum of the squared standard errors.

7.6. Postproduction Adjustments for Totals

To ensure that all geographical subunits added up to the CoC totals, we scaled the SD and the LA City / County estimates proportionally to the CoC totals, and the CD estimates proportionally to the LA City totals. For example, we took the ratio of the CoC population to the total estimated SD estimates and multiplied all of the SD estimates by this factor so that when summed they would total the CoC population. Mathematically, this adjustment was calculated as follows:

$$D_j = \frac{P}{P_j}$$

where D_j is the adjustment factor for geography j (SD, City/County, or CD), P is the estimate for the total CoC or LA City homeless population, and P_j is the total population estimate for geography j . We also applied this adjustment to the standard errors reported in the appendices. Note that we estimated subpopulations by SPA and summed over all SPAs to arrive at CoC estimates, so no adjustments were needed for SPAs.

SECTION 8: PRODUCING OVERALL ESTIMATES

Following the methodology described in Sections 6 and 7, estimates for the sheltered count and unsheltered count were generated by age and household type for various geographical levels (CoC, City/County, SPA, SD, and CD) and subpopulations. Once estimates were derived for each shelter–age and street–age combination by household type separately, we summed the shelter–age–household and street–age–household combinations to find the total count of homeless individuals for each of the various demographic and subpopulation categories of interest. Note that to avoid rounding errors and ensure all estimates added up to the total, we had to estimate prevalence rates of demographic and subpopulation categories separately for each shelter–age–household and street–age–household combination and then sum all of the outcomes.

Appendix A – Demographic Survey Instrument

Pre-Survey – FOR STAFF ONLY

DATE: ___ / ___ / ___

INTERVIEWER INITIALS: _____

TIME: ___ : ___ AM PM

SERVICE PLANNING AREA (SPA)

where you are conducting survey:

- SPA 1 SPA 3 SPA 5 SPA 7
- SPA 2 SPA 4 SPA 6 SPA 8

LOCATION / INTERSECTION

where you are conducting survey:

1st
Street:

2nd
Street:

Other:
(e.g. park or landmark)

CENSUS TRACT: **AND** **SPLIT:** (LETTER/S)

DROP-IN CENTER Survey? Yes No

This section is based on YOUR PERCEPTION(s) of the potential respondent.

Perceived GENDER:

- Male
- Female
- Gender Non-conforming
- Can't identify

Perceived RACE:

- American Indian / Alaskan Native
- Asian
- Black / African American
- Native Hawaiian / Other Pacific Islander
- White
- Multi-racial / Other
- Hispanic or Latinx
- Can't identify

Perceived AGE:

- Under 18
- 18-24
- 25-54
- 55-61
- 62+ Can't identify

Do you observe signs of ANY of the following:

- Physical health condition
- Mental illness
- Alcohol or substance use
- No Observations
- Can't identify

RESPONDENT APPROACHED?

- No, unapproached
- Yes, but refused
- Yes, but language barrier
- Yes, proceed with survey ↓

Greater Los Angeles Homeless Count

INTRODUCTION & CONSENT

*Before we begin, I want to remind you that this interview is completely voluntary and should you refuse, it will **NOT** result in any denial of services. Your answers will be kept confidential and if we should come to any questions you don't want to answer, just let me know and we'll go to the next question. We're interested in the opinions & living conditions of individuals throughout L.A. County, so I'll be asking questions about your experience with housing, services, & some things about yourself. I hope you'll find the questions interesting & want to give them careful thought.*

*If you qualify for the full survey, which takes around 30-40 minutes, you will receive a \$10 food card for your time. After we've determined that you qualify, your responses to any of the following survey questions will **NOT** affect whether you receive the food card.*

Do you understand the purpose of the survey & that your answers will be kept confidential?

Please re-read intro & verify refusal ← --- No Yes --- → **Continue with demographic survey**

KEY: Read question text to respondent

EXPERIENCE(S) OF HOMELESSNESS

15. Is this the FIRST time you have experienced homelessness?
Yes -> QUESTION #17
No
Declined
Don't know

16. How old were you the FIRST TIME you experienced homelessness?
Enter approximate age in blank -> _____(years)

17. How long have you been experiencing homelessness THIS TIME?
Enter best approximation of their response -> _____(days) _____(weeks) _____(months) _____(years)

IF LENGTH OF HOMELESSNESS = 1+ YEAR (12+ MONTHS) -> QUESTION #21 OTHERWISE - CONTINUE TO QUESTION #18 - #20

18. In the PAST YEAR, including this time, how many separate times have you experienced homelessness, on the street, in a vehicle or in shelters?
EXAMPLE: respondent was housed once for a short time in the past year & homeless before and after = 2 separate episodes of homelessness.
1 time
2 to 3 times
4 or more times
Declined
Don't know

19. In the PAST 3 YEARS, including this time, how many separate times have you experienced homelessness, on the street, in a vehicle or in shelters?
1 time
2 to 3 times
4 or more times
Declined
Don't know

20. In the PAST 3 YEARS, have you stayed in shelters or on the streets for more than 12 MONTHS total?
Yes No Declined Don't know

21. In the past 6 MONTHS, have you lived in any of these situations:
List each category to the right, if they say "yes" check the box.
Car - with (#) people
Van - with (#) people
RV/Camper - with (#) people
Tent - with (#) people
Makeshift shelter with (#) people
None of the above
Declined
Don't know

For EACH checked box, ask the following question:

22. At any given time, how many other people lived with you in the [Car, Van, Tent, etc.]?

If the respondent lived alone, please enter 0 (zero).

This next question is about your current living situation and any family members living with you. Depending on who lives with you, I may have more questions. Please remember, all your answers are confidential. Your responses will never be used to report, locate or incriminate you or anyone else.

HOUSEHOLD

23. NOT including yourself, how many adults &/or children are currently living with you in your household?
If respondent lives alone, enter 0 (zero) for both blanks. Children under 18 Adults 18+

IF 1+ CHILDREN UNDER 18 -> CONTINUE WITH PROMPT + QUESTIONS #24-#36. IF NO CHILDREN (0) -> QUESTION #37 (pg.8)

HOUSEHOLD DEMOGRAPHICS

Now I'm going to ask some personal questions about the people you live with, and you'll get an additional \$10 in compensation for these extra questions. Again, all responses are confidential.

24. I'll refer to your family members by the initials or nickname(s) you give me. Could you list the other people in your household, from youngest to oldest, using initials or nicknames?

Person 1 Person 2 Person 3 Person 4 Person 5 Person 6

CONTINUE TO HOUSEHOLD QUESTIONS #25 THROUGH #36 - - - - -> ENTER INITIALS AT THE TOP OF PAGES 5, 6, & 7

Thank you for taking the time to answer those questions about your household.

Next, I'm going to ask you some additional questions about your health and lived experiences. Due to the personal nature of some questions, we'll use a response card. So you can just tell me the answer number. As a reminder, all your answers will be kept confidential and nothing you say will get you in trouble.

HEALTH & SAFETY

37. Do you have, or have you been diagnosed with any of the following health conditions?

FOLLOW-UP SURVEY

You may be eligible for another survey through the University of California Los Angeles (UCLA) and the University of Southern California (USC) to understand the experiences of people experiencing homelessness in Los Angeles. If you choose to participate and are eligible, you will be asked to voluntarily complete a baseline survey and up to 18 monthly surveys on your mobile phone. You will receive a \$5 electronic gift card for each survey you complete. Each survey will take approximately 15 minutes.

Hand prospective participant a card with information and instructions to text an automated phone number to acquire more information.

61. Did the participant receive a card with information about the study?

- Yes
- No

Thank you so much for taking time to complete this survey. We appreciate your willingness to share information about yourself and your experiences; it helps us better understand and address homelessness.

END

Appendix B – Demographic Survey Protocols

DEMOGRAPHIC SURVEY PROTOCOLS

This document describes the protocols USC created and followed to conduct the 2022 Greater Los Angeles Homeless Count Demographic Survey, which is a component of the Homeless Count that collects information to describe individuals who are sleeping on the streets, in tents, in vehicles, or in other places not meant for human habitation in the Los Angeles Continuum of Care (CoC). This information is gathered during a 3-month data collection period where USC hires and trains a staff of 40 individuals, a portion of which are persons with lived or current experiences of homelessness, to conduct face-to-face surveys with individuals who are experiencing unstable housing and homelessness including veterans, families, and youth. With the current methodology, data collectors canvass selected census tracts throughout the LA CoC that consists of 8 Service Planning Areas (SPAs), excluding the cities of Long Beach, Pasadena, and Glendale. Demographic surveys are also collected at Safe Parking sites, Family Solution Centers (FSCs), and youth provider agencies throughout the LA CoC to better represent each subpopulation. The data collection for the Demographic Survey took place between December 10th, 2021 and March 18th 2022 and covered 505 selected census tracts across the CoC, collecting a total of 6,426 surveys during this time.

Demographic Survey

According to the Department of Housing Urban Development (HUD) the definition of unsheltered homeless is defined as, “An individual or family with a primary nighttime residence that is a public or private place not designed for or ordinarily used as a regular sleeping accommodation for human beings, including a car, park, or abandoned building, bus or train station, airport, or camping ground.”¹. This definition informs the criteria of who is eligible to take the Demographic Survey.²

The Demographic Survey consisted of 58 questions, and an additional two questions if the participant was a youth (under the age of 25). The survey took between 15-30 minutes to conduct. Questions on the survey included: basic demographic details, veteran status, experiences of homelessness, length of homelessness, household demographics, health conditions, experiences with violence (specifically domestic violence/abuse), systems involvement, residence, employment, insurance coverage, and income (full survey instrument can be found in *Appendix A*).

USC data collectors conducted the survey with individuals who met the eligibility requirements. The survey was conducted with adults (over the age of 25), youth (under the age of 25), unaccompanied minors, and families.³

¹ 24 CFR § 578.3 (retrieved from <https://www.law.cornell.edu/cfr/text/24/578.3>).

² Note that this definition does not include persons who are couch surfing or individuals who are doubled up with others.

³ HUD defines a family as having at least one adult over 18 with at least one dependent child under 18.

Upon completion of the survey, an individual participant received a \$10 gift card incentive, and a family received a \$20 gift card incentive. Incentives included a variety of options including food cards, such as McDonald's, Starbuck's, and Subway cards.

Survey Teams

In our effort to maintain a diverse team, the USC Homeless Count team comprised of individuals from 3 pivotal backgrounds: undergraduate and graduate students at USC, adults with lived experience of homelessness and other adversities, and youth from the community with lived experience and community expertise. Since 2017, we have partnered with Chrysalis, a nonprofit organization that employs and provides resources to low-income and unhoused individuals as well as using USC's approved temporary worker provider, Kelly Services, and various youth service provider agencies across the county. There were a portion of our data collectors who spoke proficient Spanish.

All data collectors attended two different types of training in the month of December. The first training focused on administering the survey instrument. Material for this training included educating data collectors on the homeless population, approach and engagement skills with participants, how to manage conflict and crisis, how to utilize the survey instrument, and overall field protocols, including COVID-19 protocols, while they are in the field and agency spaces. The second training was a trauma-informed training that provided tools and skills on how to navigate the post-stress responses and how to best support team members while out in the field that focused on understanding, recognizing, and responding to the effects of all types of trauma.

Each survey team had a team leader who served as the point person for deployment. The team leader assisted in coordinating all surveying efforts, gift card distribution, and tracking, and served as the point of contact to the USC project coordinators. Survey teams worked together to identify who would serve as a driver (voluntarily) or a navigator during field days.

USC coordinators deployed survey teams of 3-4 individuals guided by a team leader each day, throughout all 8 SPAs. Data collectors met with their teams at 8:30AM and concluded data collection between 3:30-5:00PM depending on the density of the census tracts. Survey teams were expected to show up to assigned CTs however they could (public transportation, personal vehicle, etc.) and cover census tracts by car or foot. If CTs were covered by car, there was a consented driver who was reimbursed for mileage on their assigned CTs. Data collectors met their teams each morning at a centralized accessible location such as USC main campus, USC City Center, Metro stations, agency providers, Starbuck's, McDonald's, or any other central location within the assigned census tract. Some field days included debriefs, collection/distribution of materials, and additional trainings either at the start or end of the data collection day.

Once data collection began in December, we had the survey teams covering all census tracts across all SPAs. Due to the unique nature of SPA 1 (Lancaster/Palmdale), there was a team of three data collectors who focused on covering all the census tracts in SPA 1 for the whole data collection

period, while teams who were based in Central Los Angeles covered census tracts in SPAs 2-8. USC data collectors also conducted surveys at Safe Parking sites, and youth provider agencies.

Starting in February, 10-15 USC surveyors were assigned to collect surveys at Youth Survey Sites and Safe Parking locations.

Youth Count

USC data collectors halted the majority of demographic surveying during the duration of the Youth Count which took place from February 22nd-March 15th, 2022. This was done to best utilize the limited resources given the time-sensitive nature of the Youth Count and efforts were focused on conducting the short enumeration survey for youth under the age of 25.

Family Solution Centers

FSC's are homeless service providers who focus on serving homeless families. To better represent homeless families in the CoC, we included FSCs in our sample to collect Demographic Surveys. There were 8 FSCs total that were engaged for the 2022 Homeless Count.

FSC staff were trained by the start of demographic surveying. USC coordinated a time to go to each agency to facilitate the training and to provide survey incentives and project materials for the duration of data collection. Agency staff who needed to be in attendance for the training was determined by each agency based on identifying which staff members would be conducting surveys with their clients. The training facilitated by USC included material on: what is the homeless count, data on homeless families from prior years in the CoC, why we collaborate with FSCs, how to conduct the survey with a participant, and proper form completion for survey incentives.

USC worked with each FSC throughout the duration of the data collection period to ensure they had the support they needed to successfully collect family surveys. However due to the impact of COVID-19, such as reduced staff capacity and client visits, not all FSCs collected surveys this year.

Safe Parking

Safe Parking and Safe Sleeping locations were integrated into our sample for the Demographic Survey.⁴ There was a total of 27 Safe Parking sites who participated in the Demographic Survey. USC coordinated a time and day in the month of February where 2-4 data collectors conducted surveys with patrons at Safe Parking sites. Data collection took place for one night only when the

⁴ Safe sleeping locations were added in 2022 in addition to safe parking locations that were added in 2020, to ensure they were surveyed in addition to the count of people using them being included in the visual PIT count and to improve data collection from those sleeping in vehicles. The two types of sites were grouped together. References to safe parking locations include safe sleeping locations as well.

Safe Parking sites were operating each evening which ranged from 6-11PM (the exact time was dependent on each site). Three Safe Parking sites requested virtual, phone-based surveys and these were conducted in mid-February over two days from the USC office.

Community Partners

The USC Homeless Count team collaborated with community agency providers throughout LA County to conduct Demographic Surveys in agency spaces to target specific populations (families, youth, etc.) and gather information about hotspots surrounding their agency, and specific geographical areas. Partnerships with agency providers vary upon their involvement with either hotspot planning that occurs prior to the start of data collection or having an agency as a survey site to conduct surveys with the clients that they serve during the data collection period. USC is grateful for these partnerships as the Homeless Count would not be successful without the participation of community volunteers and partner agencies. USC worked in collaboration with the following agencies for the Demographic Survey for the 2022 Homeless Count: End Homelessness California, Hope of the Valley Rescue Mission, North Valley Caring Services, Safe Parking LA, Special Service for Groups, Inc., Volunteers of America of Los Angeles, Watts Labor Community Action Committee, Urban Alchemy, Valley Oasis, LA Family Housing, Union Station Homeless Services, PATH, St. Joseph Center, Hopics, The Whole Child, Harbor Interfaith Services.

Akido Labs

The USC Homeless Count team continued its partnership with Akido Labs for the 2022 Homeless Count. The USC survey team used their phone application to help with the logistics of data collection. Specifically, the app helped survey teams identify and locate CTs from a bird's eye view that needed to be canvassed, provided hotspot data information, GPS tracked which specific streets were covered by the survey team, included census tract assessments to be completed after each census tract had been canvassed, and had each team's deployment information for reference.

INTRODUCTION & CONSENT

*Before we begin, I want to remind you that this interview is completely voluntary and should you refuse, it will **NOT** result in any denial of services. Your answers will be kept confidential and if there are any questions you don't want to answer, just let me know and we'll skip it. We're interested in individuals throughout L.A. County, so I'll be asking a few questions about your experiences and some things about yourself. Hopefully, you'll find the questions interesting & want to give them careful thought.*

If you qualify for the survey, which takes 5-10 minutes, you will receive a \$10 food card for your time. After we've determined that you qualify, your responses to any of the following survey questions will NOT affect whether you receive the food card.

Do you understand the purpose of the survey & that your answers will be kept confidential?

Please re-read intro & verify refusal ← --- No Yes → **Continue with youth enumeration survey**

IF EITHER QUESTION #2 OR #3 = UNSHELTERED (2ND & 3RD COLUMNS), THEY ARE ELIGIBLE – CONTINUE

IF BOTH QUESTION #2 AND QUESTION #3 = SHELTERED (1ST COLUMN), RESPONDENT IS INELIGIBLE – READ PROMPT:

I'm sorry, you do not qualify for the full survey. Thank you for your time. MOVE ON TO NEXT RESPONDENT

You are eligible for the survey. We'll start with some questions about you & your experiences.

INDIVIDUAL DEMOGRAPHICS

5. What are the initials of your FIRST and LAST name? { First Last } _____

6. What gender do you identify with? (Select all that apply) Male Questioning
Wait for response and choose one answer. Read each category if response given is not listed. Female Declined
 Gender Non-conforming Don't know

7. Do you identify as transgender? **PLEASE USE RESPONSE CARD.** (1) Yes (2) No Declined
 Don't know

8. Which best represents your sexual orientation? (1) Gay (3) Lesbian Declined
PLEASE USE RESPONSE CARD. (2) Straight (4) Bisexual Don't know
 (5) Unsure/Questioning

9. What race OR races do you identify with? *Wait for response & choose ALL that apply. IF response isn't listed, read each choice.*

<input type="checkbox"/> American Indian or Alaska Native, specify tribe: _____		
<input type="checkbox"/> White	<input type="checkbox"/> Vietnamese	<input type="checkbox"/> Other Asian, specify: _____
<input type="checkbox"/> Black or African-American	<input type="checkbox"/> Filipino	<input type="checkbox"/> Other Pacific Islander, specify: _____
<input type="checkbox"/> Asian Indian	<input type="checkbox"/> Native Hawaiian	<input type="checkbox"/> Some other race, specify: _____
<input type="checkbox"/> Chinese	<input type="checkbox"/> Guamanian or Chamorro	<input type="radio"/> Declined
<input type="checkbox"/> Japanese	<input type="checkbox"/> Samoan	<input type="radio"/> Don't know
<input type="checkbox"/> Korean	<input type="checkbox"/> Hispanic/Latinx----	

10. Do you identify as Hispanic or Latinx? **IF HISPANIC / LATINX, ASK:** Could you describe your Hispanic / Latinx background?

<input type="radio"/> Yes ----->	<input type="checkbox"/> Central American	<input type="checkbox"/> Puerto Rican
<input type="radio"/> No, not of Hispanic / Latinx origin	<input type="checkbox"/> South American	<input type="checkbox"/> Cuban
<input type="radio"/> Declined	<input type="checkbox"/> Spanish (from Spain)	<input type="radio"/> Declined
<input type="radio"/> Don't know	<input type="checkbox"/> Mexican, Mexican American, Chicano	<input type="radio"/> Don't know
	<input type="checkbox"/> Other Hispanic/Latinx origin: _____	

HOUSEHOLD

Now I'm going to ask you some questions about your current living situation, specifically if you have family members living with you. Please remember, all your answers are confidential. Your responses will never be used to report, locate or incriminate you or anyone else.

11. Do you live with a spouse or partner? No Declined
If "Yes", ask for spouse/partner's age -> Yes, their age: _____ Don't know

12. Do you (or your spouse/partner) have any children under 18 currently living with you in your household? No ----> **END** Declined
 Yes Don't know

IF QUESTION #12 = Yes - CONTINUE TO QUESTION #13.

OTHERWISE -> END

13. How many children under 18 are currently living with you in your household?
IF respondent lives alone, enter 0 (zero) in blank. # children under 18 = _____

Thank you so much for taking time to complete this survey. We appreciate your willingness to share information about yourself and your experiences; it helps us better understand and address homelessness.

14. What is the completion status of this survey?

- Completed Partial

GIFT CARD INCENTIVE

15. Please enter the last 6 digits of the gift card: _____

16. If you provided a 2nd gift card, please enter the last 6 digits of 2nd gift card here: _____

SURVEY COMPLETE. *You have completed the survey. Thank you!*

END

Appendix D – Youth Count Protocols

YOUTH COUNT PROTOCOLS

This document describes the steps USC followed to conduct the 2022 Greater Los Angeles Youth Count: a survey-based count which is divided into two separate survey instruments. The Youth Enumeration Survey took place between February 22nd and March 15th, 2022 (Youth Count Week) and the Youth Descriptive Survey took place between December 10th, 2021 and March 18th, 2022. The Youth Count is a component of the Homeless Count that collects data to describe the unsheltered youth population in the Los Angeles Continuum of Care (CoC). The Homeless Count team hires and trains a staff of 40 USC personnel along with our many volunteer youth service providers and community advocates to conduct surveys with youth who are experiencing literal homelessness. Data collectors cover selected census tracts throughout the LA CoC which consists of 8 different Service Planning Areas (SPAS), excluding Long Beach, Pasadena, and Glendale.

The Youth Count Surveys

In 2020, USC and LAHSA revised its methods to address data collection challenges that are faced by youth providers with limited capacity and resources. Specifically, the revised method divided data collection between enumeration (short survey) and description (long survey).

In order to be eligible to participate in either form of the Youth Count survey, participants need to meet two different requirements related to housing status and age. According to the Department of Housing Urban Development (HUD), the definition of unsheltered homeless is defined as, “An individual or family with a primary nighttime residence that is a public or private place not designed for or ordinarily used as a regular sleeping accommodation for human beings, including a car, park, or abandoned building, bus or train station, airport, or camping ground.”¹ This definition informs the criteria of who is eligible to take the Youth Count survey.

This definition does not include persons who are couch surfing, or individuals who are “doubled up” with others. Further, those individuals who are 25 or older are not eligible for Youth Count survey participation. These individuals would instead be captured in our Demographic Adult Count. Youth who **are eligible** for the survey include unaccompanied minors, young families, and youth under the age of 25.

Youth Enumeration Survey

The Youth Count Enumeration Survey consisted of 13 questions. The survey took between 5-12 minutes to complete. The questions on the survey included basic demographic details, family members, and children in their care (full survey instrument can be found in *Appendix C*). The focus of this survey tool was to count as many unsheltered young people as possible within the extended Youth Count time frame between February 22nd, 2022 and March 15th, 2022.

¹ 24 CFR § 578.3 (retrieved from <https://www.law.cornell.edu/cfr/text/24/578.3>).

Volunteer youth service providers, volunteer community members, and USC data collectors were instructed to conduct the survey with youth who met the eligibility requirements.

Upon completion of the survey, an individual participant received a \$10 McDonald's gift card incentive and a family received two \$10 McDonald's gift card incentives.

Youth Descriptive Survey

The Youth Count Descriptive Survey consisted of 60 questions. The survey took between 15-30 minutes to complete. The questions on the survey were identical to the Demographic Adult Survey which included: basic demographic details, veteran status, experiences of homelessness, length of homelessness, household demographics, health conditions, experiences with violence (specifically domestic violence/abuse), systems involvement, residence, employment, insurance coverage, and income. Additional youth-specific questions were included in the survey on education and experience in the child welfare system (full survey instrument can be found in *Appendix A*). The focus of this survey tool was to capture detailed demographics and other relevant descriptive information related to unsheltered youths' experience in LA CoC.

USC data collectors were the only staff to conduct the survey with potential participants who met the eligibility requirements.

Upon completion of the survey, an individual participant received a \$10 McDonald's gift card incentive and a family received two \$10 McDonald's gift card incentives.

Survey Teams

USC Survey Teams

Please see Demographic Survey Protocols (*Appendix B*) for a detailed description of training and composition of the USC Survey Teams.

Volunteer Survey Teams

Volunteer agencies served as survey sites where unsheltered youth could come to be surveyed anytime between February 22nd and March 15th, 2022. Individual community volunteers were restricted from participating in late nights shifts due to safety concerns and lack of experience with the population.

Most agencies had a dedicated survey site coordinator who coordinated the inflow of volunteers from their agencies and individual volunteer networks, scheduled street team deployments, recruited youth navigators to support with street surveying, tracked gift card distribution to staff and other sites, and ensured every volunteer participated in a training on the survey instrument and protocols. If an agency did not have the capacity to provide a site coordinator, Lens Co staff were assigned to support the needs of that particular site.

Youth Count Data Collection Strategy

Enumeration Survey Data Collection Strategy

The Youth Enumeration Survey employed two types of location-based data collection strategies: 1) street survey teams and 2) survey sites.

Street survey teams were assigned and coordinated to conduct surveys in selected census tracts (CTs). Street survey teams conducted surveys in the community space of CTs with higher populations of youth allocated to youth service provider staff and volunteers.

Street survey teams had varied deployment time frames, with shifts generally ranging from 9am-12pm, 12pm-1pm, 1pm-5pm, and 5pm-9pm. These time frames varied based off agency preferences, e.g. SPA 4 specifically chose to only have their agency street survey teams deploy for the early morning and late night shifts during their Blitz day.

Street survey teams consisted of:

- Surveyors - USC staff, youth provider staff, LAHSA staff, or youth provider approved volunteers who completed all necessary trainings.
- Youth Navigators - youth with local SPA knowledge, recruited and approved by youth providers, who assisted in the identification and engagement of potential youth experiencing homelessness.
- Transporters - USC staff, youth provider staff, LAHSA staff, or approved volunteers tasked with transporting street survey teams. Survey teams deployed from census tracts from within the community or deployment sites within each SPA (centralized meeting place where street survey teams gathered to coordinate, review, and prepare for surveying).

Survey Sites are community organizations where youth experiencing homelessness typically access services. Survey Site coordinators agreed to provide staffing resources to assist in survey data collection ranging from one to 20 days (approved by HUD). Survey Sites were instructed to assess eligibility of all youth accessing services at the Survey Site and administer the survey to all eligible youth on the same day if possible.

There were 2 survey sites in SPA 1, 1 survey site in SPA 2, 1 survey site in SPA 3, 3 survey sites in SPA 4, 2 survey sites in SPA 5, 3 survey sites in SPA 6, 2 survey sites in SPA 7, and 3 survey sites in SPA 8.

Youth Count Enumeration Survey data collection happened in two timeframes: 1) blitz days and 2) extended time period data collection.

Blitz days occurred in all eight SPAs, USC supported a blitz day model in which youth homelessness provider organizations dedicated resources (i.e. staff, volunteers, transportation) to

canvas the geography of the selected CTs and conduct as many surveys with homeless youth as possible on a predetermined day (or days). USC staffed surveyors supported youth homelessness provider organizations and volunteers in creating street survey teams who canvassed CTs that were identified in the sampling strategy.

During the blitz days, street survey teams prioritized CTs that were identified as including hotspots in which homeless youth were expected to be found. Additionally, hotspot data was used to strategize the times (morning, afternoon, evening) that street teams canvassed CTs. As youth homelessness providers did not have the capacity to canvas all CTs included as part of the youth count sample during blitz days, street survey teams covered any remaining CTs during an extended time period. This included non-hotspot CTs and CTs that required specialized deployment, such as those with unique geography (e.g. mountains, airports, river beds) or large geographic areas to cover.

Extended time period data collection involved SPA-specific deployment plans based on the capacity of youth homelessness provider organizations in each of the eight SPAs. USC developed SPA-specific deployment plans to canvas the 437 total CTs that were sampled across Los Angeles County for the Youth Count. Each SPA's YCES Regional Coordinator served as the point person for information related to Youth Count Week. The Lens Co Youth Count Coordinator took the lead as contact for provider staff during Youth Count Week with support from the YCES Regional Coordinator throughout the week. The Youth Count Coordinator assisted in coordinating CT maps and gift cards, and served as the point of contact for provider based surveyors, volunteers and youth navigators. LAHSA Community Engagement Coordinators also served as leadership support engaging partners in hotspot planning as well as volunteering their time during the 20-day data collection period.

Descriptive Survey Data Collection Strategy

Please see Demographic Survey Protocols (*Appendix B*) for a detailed description of data collection protocols.

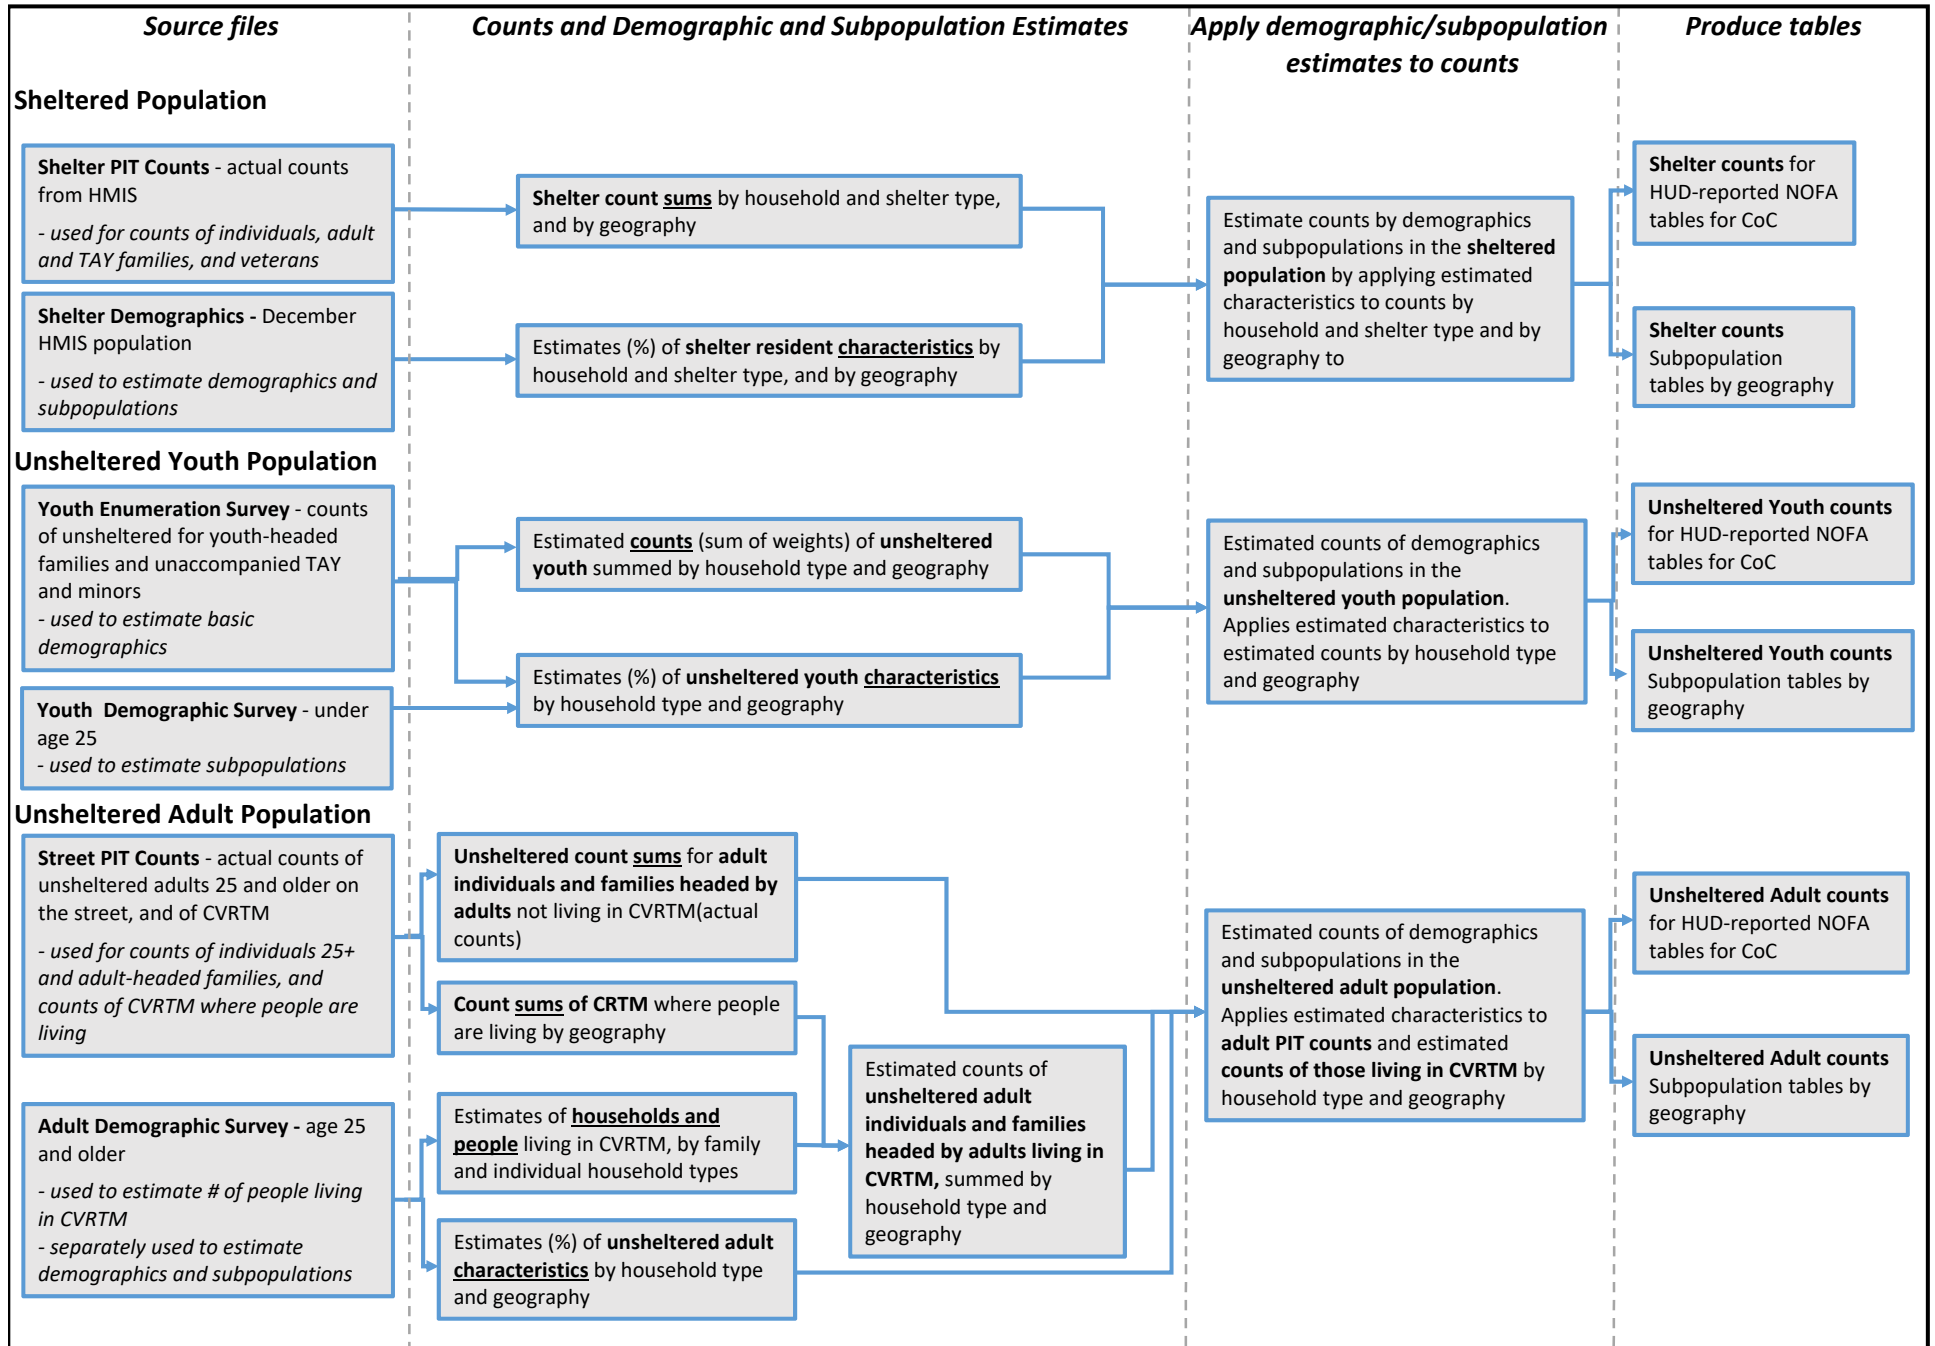

Community Partners

The USC Homeless Count team collaborated with community agency providers throughout LA County to conduct both the youth descriptive and enumeration surveys in agency spaces to target the youth population and gather information about hotspots surrounding their agency and specific geographical areas. Partnerships with agency providers vary upon their involvement with either hotspot planning that occurs prior to the start of data collection or having an agency as a survey site to conduct surveys with the clients that they serve during the data collection period. USC is grateful for these partnerships as the Homeless Count would not be successful without the participation of community volunteers and partner agencies. USC worked in collaboration with the following agencies for the Youth Count Survey for the 2022 Homeless Count:

Valley Oasis
Mental Health America
The Children's Center of the Antelope Valley
Penny Lane Centers
Volunteers of America
The Village Family Services
Pacific Clinics Hope Drop-In Center
My Friend's Place
Los Angeles LGBT Center
Covenant House
Safe Place for Youth
Daniel's Place
Sanctuary of Hope
Coalition for Responsible Community Development (Ruth's Place Access Center)
The Good Seed
Jovenes, Inc.
Penny Lane Centers
Harbor Interfaith Services
Sanctuary of Hope
El Camino College
Fathers And Mothers Who Care
